**ABSTRACT**

*Regional economic growth is a series of economic policy efforts aimed at improving the welfare of society, expanding employment opportunities, flattening income distribution, and improving economic relations between the regions within the region and between the region and the developed economies are sectoral and cross-sectoral strategies supported by more favorable human resources in Indonesia. This study aims to: 1) Looking at the influence of economic growth on paddy land in Bogor Regency, 2) Looking at the influence of population on land and rice fields in Bogor regency 3) Looking at the influence of economic development and population together against widespread wetland in Bogor regency. Data were analyzed using SPSS program to see the shape of the relationship and the relationship between the independent variables, namely GDP and population size of the dependent variable is the total area of rice fields in Bogor Regency, 1999 s / d 2009 used regression and correlation analysis. From the analysis of the data concluded that the increase in GDP and population have a significant effect on the decline in rice area in Bogor Regency, 1999 s / d in 2009, but the influence of the joint between the GDP and population of the rice area GDP is only significant effect on rice area while population does not significantly influence the rice area in Bogor Regency, 1999 s / d 2009. Increase in GDP and population collectively influence on rice area in Bogor Regency, where GDP increased significantly influence the broad decline in rice fields, where every increase in GDP of 1 billion rupiah reduce rice area of 0037 acres, but did not significantly affect the population of the rice area in the district Bogor 1999 s / d 2009.*
